tropical rain forests are the most complex varied and species rich terrestrial ecosystems on earth however these unique forests are more and more threatened by human activities about half of the originally forested area has been deforested in the past decades and the pressure on today s remaining rain forests is still growing the german indonesian research project storma stability of rainforest margins in indonesia analyses the causes circumstances and consequences of rain forest conversion in its survey area in central sulawesi indonesia vast areas of intact rain forest still exist but are currently facing increasing exploitation by the rural population especially the expansion of cultivation area for cocoa and maize represents a major threat for local rain forests remote sensing plays an important role in the examination of rain forest loss because it allows the regionalisation and quantification of spatial developments at different scales in his book christian knieper gains information about land cover and land cover change in central

sulawesi on the basis of a landsat 7 etm time series he applies a modern object oriented approach which allows the analysis of non spectral features e g shape spatial relations thematic data and goes beyond the pure isolated statistical examination of each pixel s spectral values offered by traditional remote sensing techniques the gathered results on land cover change provide essential information for socio economic as well as ecological research activities within storma
